

Overview

- Why Mock Objects?
 - “Mockist” **vs.** “Classic” TDD
 - “Mockist” **and** “Classic” TDD
- Mocks and Smalltalk:
 - The Mocketry framework introduction
- Examples

Why Mock Objects?

Do we need Mocks at all
(in Smalltalk)?

Public Opinion

- Smalltalk vs. Mock Objects?
 - Few/rare special cases
 - With mock you don't test real thing
 - Use mocks for external objects only
 - Use other means to involve complex external objects
 - Speed up by other means

Public Opinion

...seems to be about **testing**

Smalltalk and Mock Objects

- “Mock Objects” is a TDD technique
 - ... about **developing** systems
 - ... **not** just testing
 - ... useful in **all languages**
- **Smalltalk** makes mocks
 - much easier to use

Why Mock Objects?

- **Cut off dependencies** in tests
- Test-Driven **Decomposition**
 - Discover Responsibility (for collaborators)
 - Thinking vs. Speculating/Fantasizing

Seamless TDD

What Is The Problem?

- Dependencies
 - How to cut them off?
- Novel Collaborators
 - Where to cut?

What Is The problem?

- **Dependencies**
 - **How to cut them off?**

- **Novel Collaborators**
 - **Where to cut?**

Dependencies

We have:

- System Under Development (**SUD**)
- Collaborators
- Collaborators' collaborators ...

Complex Test

So What?

We have to implement collaborators

- ... without tests
- ... loosing focus on SUD

Digression

Dependencies: Example

- **Mocks Aren't Stubs** by Martin Fowler
- Filling orders from warehouse

Filling Order

```
OrderTests >>
```

```
  testIsFilledIfEnoughInWarehouse
```

```
  | order |
```

```
  order := Order on: 50 of: #product.
```

```
  order fillFrom: warehouse.
```

```
  self assert: order isFilled
```

Filling Order

```
OrderTests >>
```

```
testIsFilledIfEnoughInWarehouse
```

```
| order warehouse |
```

```
warehouse := Warehouse new.
```

```
"Put #product there"
```

```
"...but how?!"
```

```
order := Order on: 50 of: #product.
```

```
order fillFrom: warehouse.
```

```
...
```

Digression Detected!

- I develop **Order**
- I **don't** want to think about **Warehouse**

Filling Order

```
OrderTests >>
```

```
testIsFilledIfEnoughInWarehouse
```

```
| order warehouse |
```

```
warehouse := Warehouse new.
```

```
warehouse add: 50 of: #product.
```

```
order := Order on: 50 of: #prod.
```

```
order fillFrom: warehouse.
```

```
...
```

...And Even More Digression

Reduce amount of #product at the warehouse

test...

...

```
self assert:
```

```
  (warehouse
```

```
    amountOf: #product)
```

```
      isZero
```

... And Even More Digression

Another test case:

If there isn't enough #product in the warehouse,

- do not fill order**
- do not remove #product from warehouse**

... Much More Digression

More complex test cases

Collaborators' logic becomes more
and more complex...

This can engulf

Not-So-Seamless TDD

- SUD is Order
- Warehouse blures SUD
 - #add:of:
 - #amountOf:
- No explicit tests for Warehouse

Mocking Warehouse

```
OrderTests >>
```

```
  testIsFilledIfEnoughInWarehouse
```

```
    | order |
```

```
      order := Order on: 50 of: #product.
```

```
    [
```

```
      :warehouse |
```

```
      [order fillFrom: warehouse]
```

```
        should satisfy:
```

```
          [ "expectations" ]
```

```
    ] runScenario.
```

```
    self assert: order isFilled
```

Mocking Warehouse

...

```
[ :warehouse |  
  [order fillFrom: warehouse]  
    should satisfy:  
      [ (warehouse  
         has: 50 of: #product)  
        willReturn: true.  
        warehouse  
          remove: 50 of: #product ]  
    ] runScenario.
```

...

The Mocketry Framework

Mock Objects in
Smalltalk World

Behavior Expectations

When you do this with SUD,
expect that to happen
with collaborators

Collaborators are mocked

Behavior Expectations

Do this

Exercise

Expect that

Verify

Scenario

Mockery Scenario Pattern

SomeTestCases >> testCase

[

testScenario

] runScenario

Mockery Scenario Pattern

SomeTestCases >> testCase

[

[exercise]

should *strictly* satisfy:

[behaviorExpectations]

] runScenario

Behavior Expectations

- Just send mock objects the messages they should receive

```
warehouse
```

```
  has: 50 of: #product
```

- Specify their reaction

```
(warehouse
```

```
  has: 50 of: #product)
```

```
  willReturn: true
```

Mockery Scenario Pattern

SomeTestCases >> testCase

[

[exercise] should *strictly* satisfy: [behaviorExpectations]

[exercise] should *strictly* satisfy: [behaviorExpectations]

... do anything

] runScenario

Mockery Scenario Pattern

SomeTestCases >> testCase

[**:mock** |

[exercise] should *strictly* satisfy: [behaviorExpectations]

[exercise] should *strictly* satisfy: [behaviorExpectations]

... do anything

] runScenario

Mockery Scenario Pattern

SomeTestCases >> testCase

[**:mock** |

[exercise] should *strictly* satisfy: [behaviorExpectations]

[exercise] should *strictly* satisfy: [behaviorExpectations]

... do anything

] runScenario

Mockery Scenario Pattern

SomeTestCases >> testCase

[:mock1 :mock2 :mock3 |

[exercise] should *strictly* satisfy: [behaviorExpectations]

[exercise] should *strictly* satisfy: [behaviorExpectations]

... do anything

] runScenario

Trivial Example 1

```
TrueTests >>
```

```
    testDoesNotExecuteIfFalseBlock
```

```
[ :block |
```

```
    [true ifFalse: block ]
```

```
        should satisfy:
```

```
            [“nothing expected”]
```

```
] runScenario
```

Trivial Example 2

```
TrueTests >>
```

```
    testExecutesIfTrueBlock
```

```
[ :block |
```

```
    [true ifTrue: block]
```

```
        should satisfy:
```

```
            [block value]
```

```
] runScenario
```

State Specification DSL

- `resultObject should <expectation>`
 - `result should be: anotherObject`
 - `result should equal: anotherObject`
 - ...

Mocketry

- There is much more...
- Ask me
- ...or **Dennis Kudryashov** (the Author)

Mocking Warehouse

```
OrderTests >>
```

```
testIsFilledIfEnoughInWarehouse
```

```
| order |
```

```
order := Order on: 50 of: #product.
```

```
[ :warehouse |
```

```
  [order fillFrom: warehouse]
```

```
    should satisfy:
```

```
      [(warehouse has: 50 of: #product)
```

```
        willReturn: true.
```

```
      warehouse remove: 50 of: #product]
```

```
] runScenario.
```

```
self assert: order isFilled
```

Mocking Warehouse

```
OrderTests >>
testIsNotFilledIfNotEnoughInWarehouse
| order |
order := Order on: #amount of: #product.
[:warehouse |
  [order fillFrom: warehouse]
  should satisfy:
  [(warehouse has: 50 of: #product)
   willReturn: false.
   "Nothing else is expected" ]
] runScenario.
self assert: order isFilled
```

What We Get

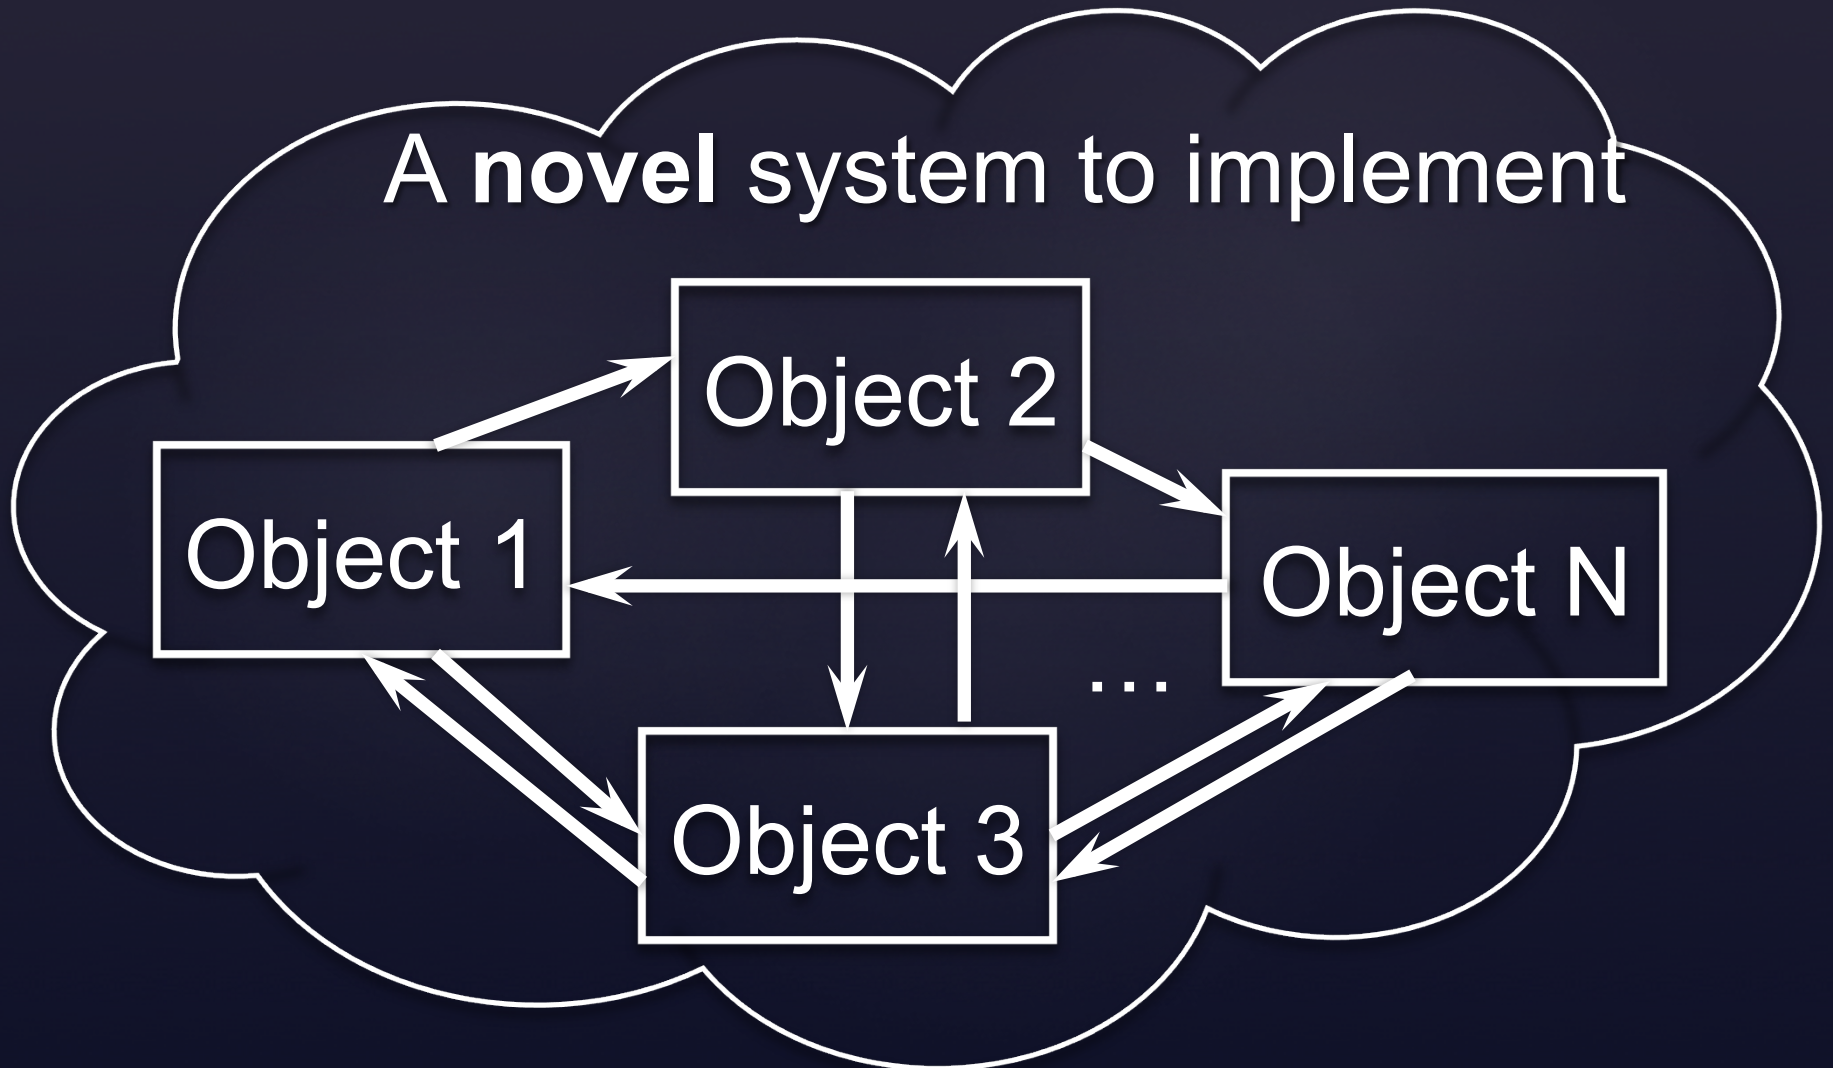

- No need to implement Warehouse
- Just specify expectations
- ... right in the test
- Focus on **the SUD**

What's the problem?

- Dependencies
- **Novel Collaborators**

Where to Start?

A novel system to implement

Where to Cut?

A novel system to implement

Where to Start?

- Try to guess
 - ... and be ready to abandon test(s)
 - ... or get a mess

Or

- **Analyze** thoroughly
 - ... up-front decomposition
 - ... **without** tests — just a fantasy

Novel Collaborators: Example

Bulls and Cows Game

- Computer generates a secret key
 - e.g., a 4-digit number
- Human player tries to disclose it

Bulls and Cows Game

Scenario:

- User creates a game object
- **User starts the game**
 - **Game should generate a key**
- ...

testGeneratesKeyOnStart

```
self assert: key ...?
```

```
"How to represent key?!"
```

What Can I Do?

- Spontaneous representation
 - Do you feel lucky?
- Analyze thoroughly
 - Give up TDD
- Postpone the test
 - Not a solution

What Can I Do?

- ...
- Create a new class for key
 - Unnecessary complexity?

What Can I Do?

That was a **Digression!**

testGeneratesKeyOnStart

```
|key|  
game start.  
key := game key.  
self assert:  
    key isKindOf: Code
```

testGeneratesKeyOnStart

```
[ :keyGen |
  game keyGenerator: keyGen.
  [ game start ]
    should satisfy:
      [keyGen createKey
        willReturn: #key]
  game key should be: #key
] runScenario.
```

What We Get

- **Key generation functionality**
 - is revealed
 - moved to another object
- **Dependency Injection**
 - fake key can be created for tests
 - KeyGenerator refactored to Turn
- **No risk of incorrect decision**

What We Get

Seamless TDD:

- No digression
- No up-front decomposition
- No up-front design
- No speculating / fantasizing

Complete Example

Mock Objects For Top-Down Design
by Bulls-and-Cows Example

Just ask!

Classic vs. Mockist TDD

State vs. Behavior?

Result vs. Intention?

No contradiction!

Mockist approach
complements “classic” TDD

Classic and Mockist TDD

- Top-Down with Mockist TDD
 - Analysis and Decomposition
- Bottom-Up with Classic TDD
 - Synthesis and “real-object” testing
