Think
Green
Reuse ♻️ Recycle

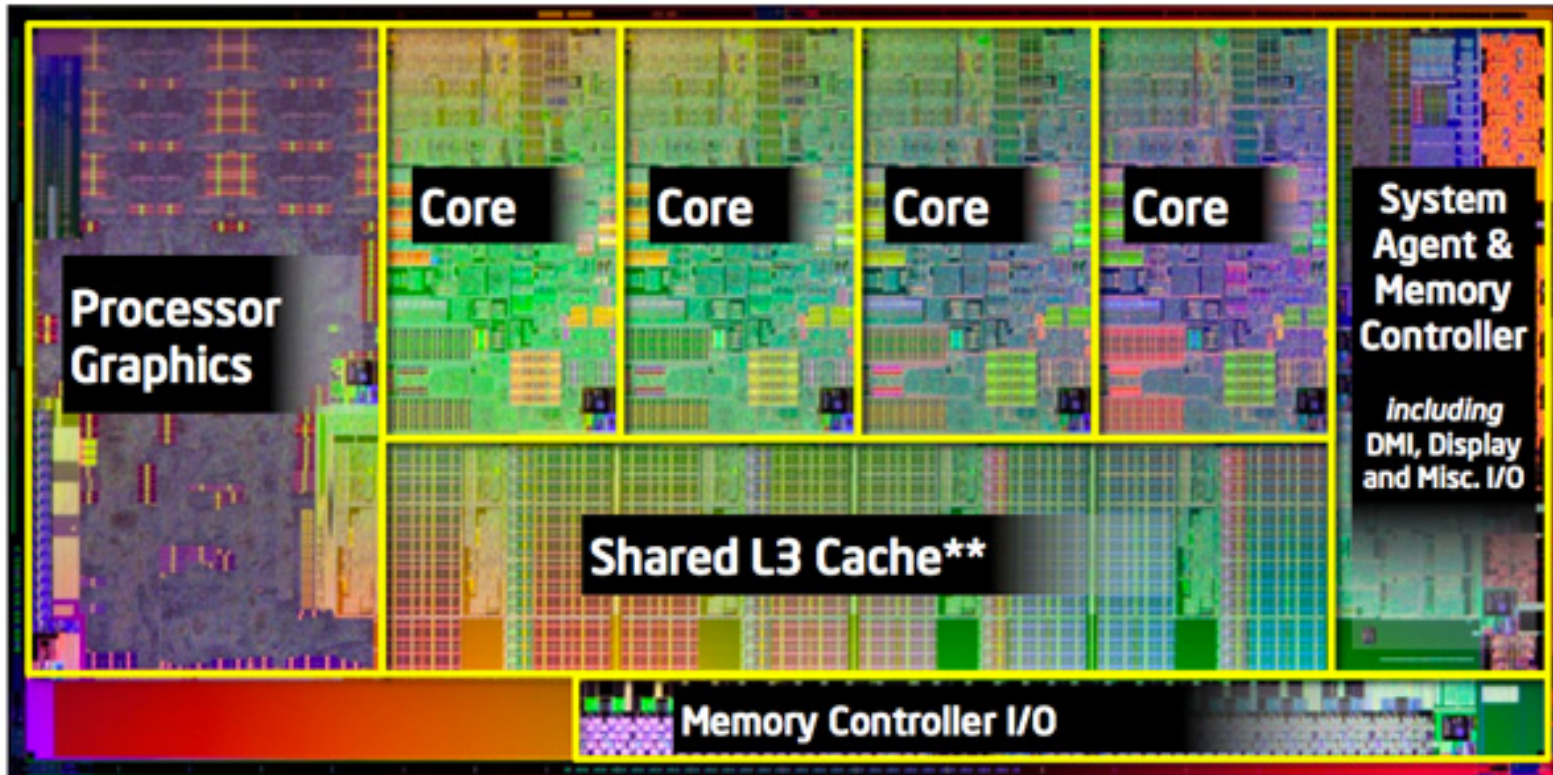

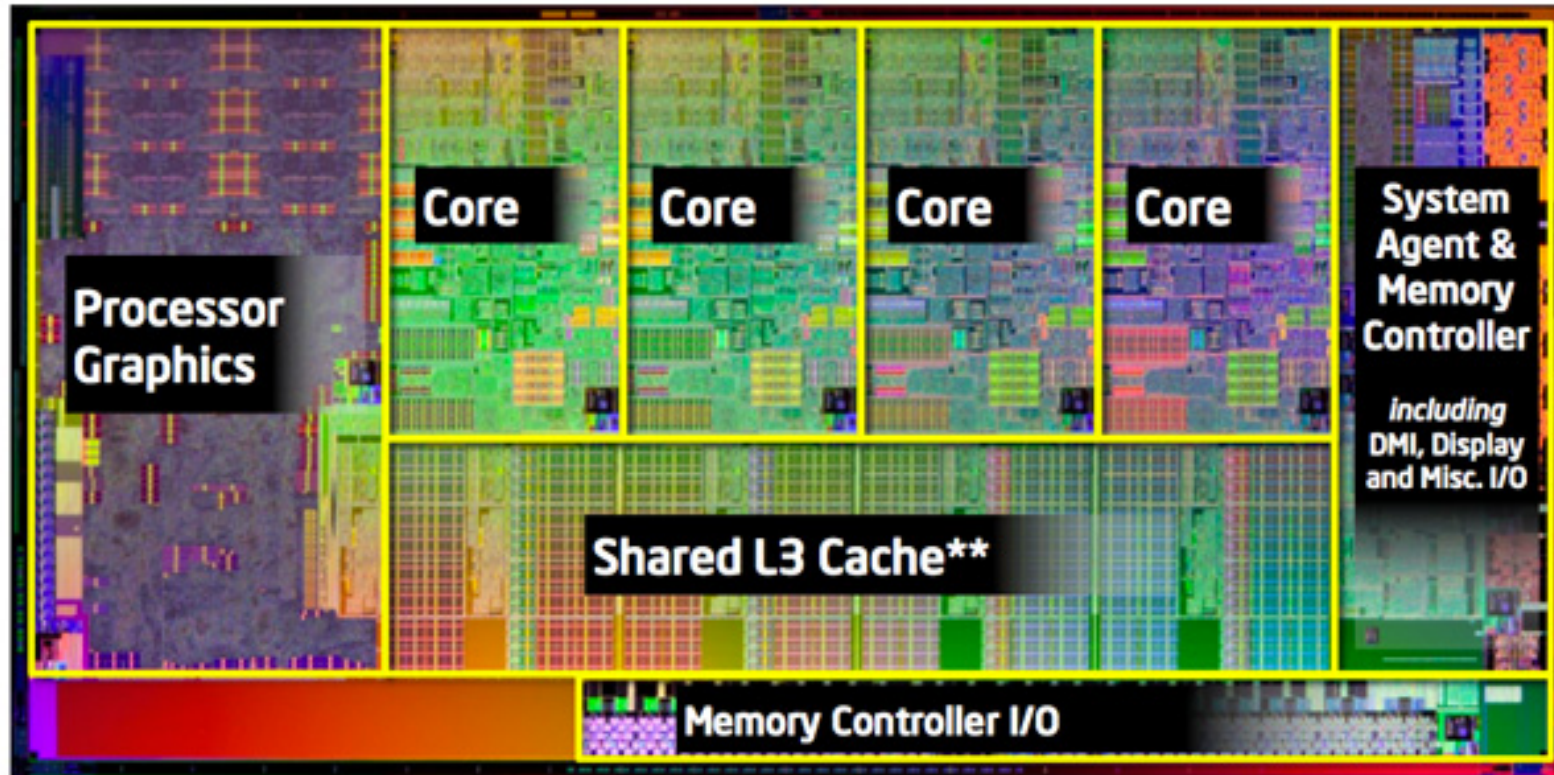

Joule (J) is a unit of energy
Lifting 100g by one meter = 1 J

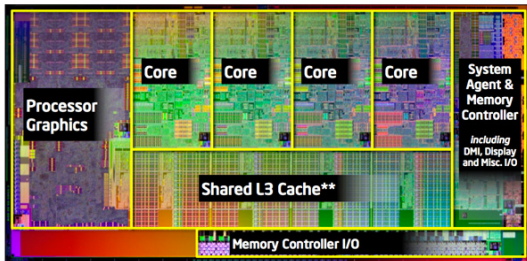

Watt (W) is a unit of power
defined as Joule / second

$$1 \text{ W} = 1 \text{ J} / \text{s}$$

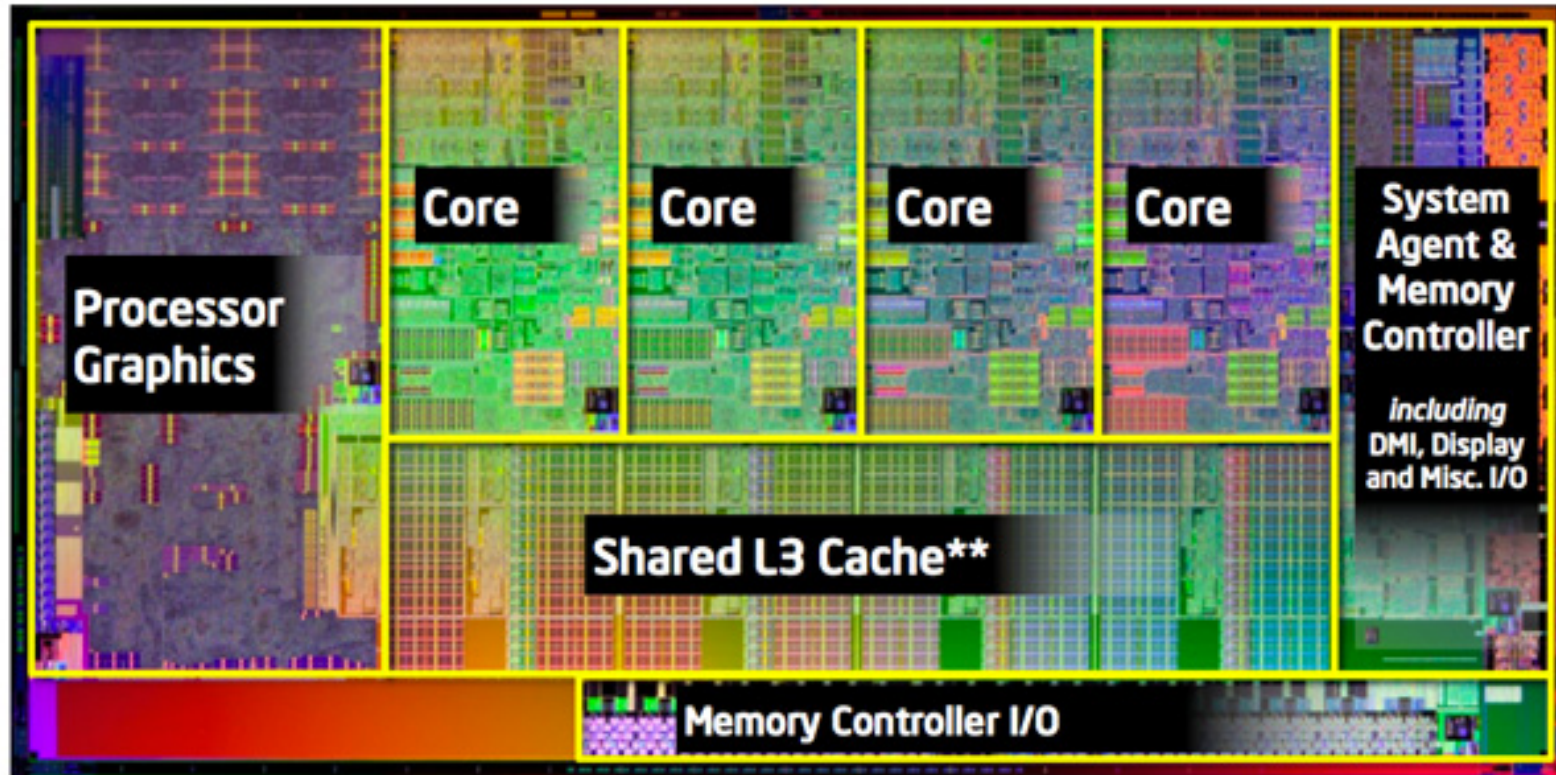

$PkgPower$ for the whole processor ($5 \leq PkgPower \leq 40W$)
 $IAPower$ for the cores ($2 \leq IAPower \leq 35 W$)

$PkgPower$ for the whole processor ($5 \leq PkgPower \leq 40W$)
 $IAPower$ for the cores ($2 \leq IAPower \leq 35 W$)

$PkgPower$ for the whole processor ($5 \leq PkgPower \leq 40W$)
 $IAPower$ for the cores ($2 \leq IAPower \leq 35 W$)
 $PkgTemp$ graphic & cores (between 40 and 60 C)

$PkgPower$ for the whole processor ($5 \leq PkgPower \leq 40W$)
 $IAPower$ for the cores ($2 \leq IAPower \leq 35 W$)
 $PkgTemp$ graphic & cores (between 40 and 60 C)
 $IAFreq$ CPU frequency ($1.7 GHz \leq 3.2GHz$ I5 ≤ 3.6)

Software & Hardware

Pharo 5 image & Cog

OS X El Capitan, version 10.11.4

Studied Intel Core i5 on an iMac (3.2Ghz)

Experiments have been made at 22 C

Network and screen disabled

Virtual Machine Launch & Being Idle

Operating system

PkgPower = 6W

IAPower = 2.5W

PkgTemp = 42C

IAFreq = 1.78Ghz

VM Launch

Opening a 47Mb image consumes 3mWh

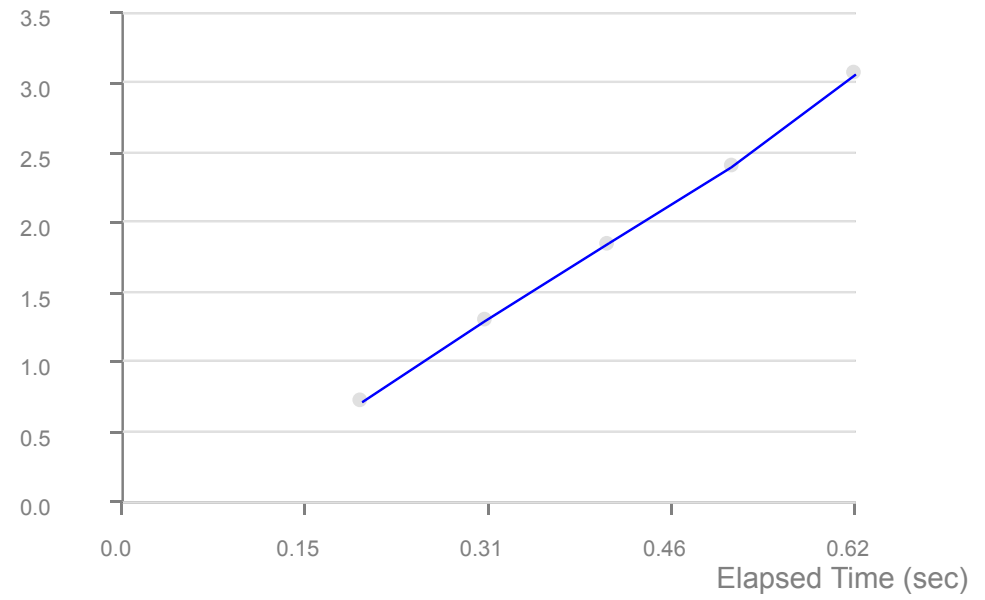

Pharo open and doing nothing

PkgPower = 6W (despite the few % of CPU consumption)

PkgPower(Watt)

CuPakPower(mWh)

5 Micro-benchmarks

- *G1*: Creation and elimination of memory blocks large of 3 Mb, represented as an Array.
- *G2*: *G1* and the memory space are sequentially filled with an arbitrary immediate value.
- *G3*: Creation and elimination of small memory blocks, large of 10 Kb, represented as an Array.
- *G4*: *G3* and the memory space are sequentially filled with an arbitrary immediate value.
- *Rec*: Recursively computing a large numerical sequence.

4 Macro-benchmarks

- *FB*: Computing a force based layout on a graph made of 5,000 nodes and 5,000 edges.
- *Graph*: Constructing a graph large 70,000 nodes and 70,000 edges.
- *Plot*: Plotting 30,000 numerical values.
- *Comp*: Compiling over 3,800 Pharo methods.

Benchmark execution

Wait 10 seconds between each run, to make sure that the CPU cools down

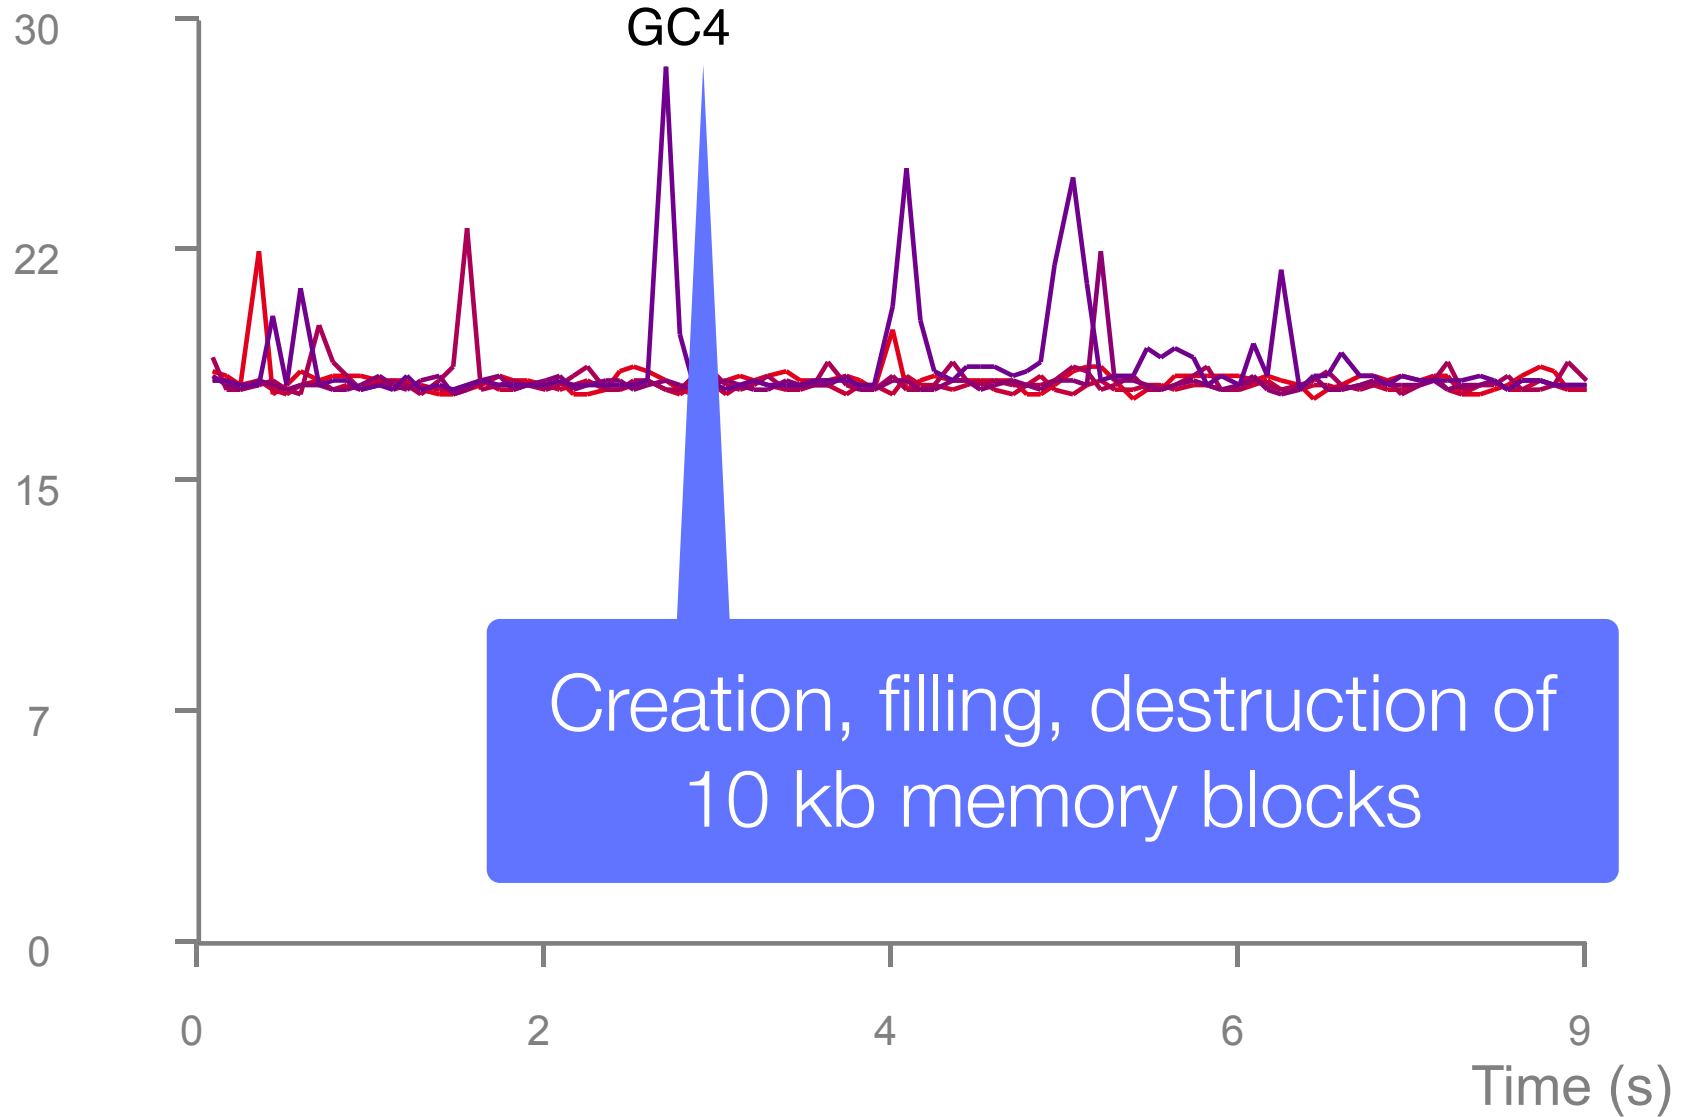

Micro-Benchmark execution

PkgPower (W)

Micro-Benchmark execution

PkgPower (W)

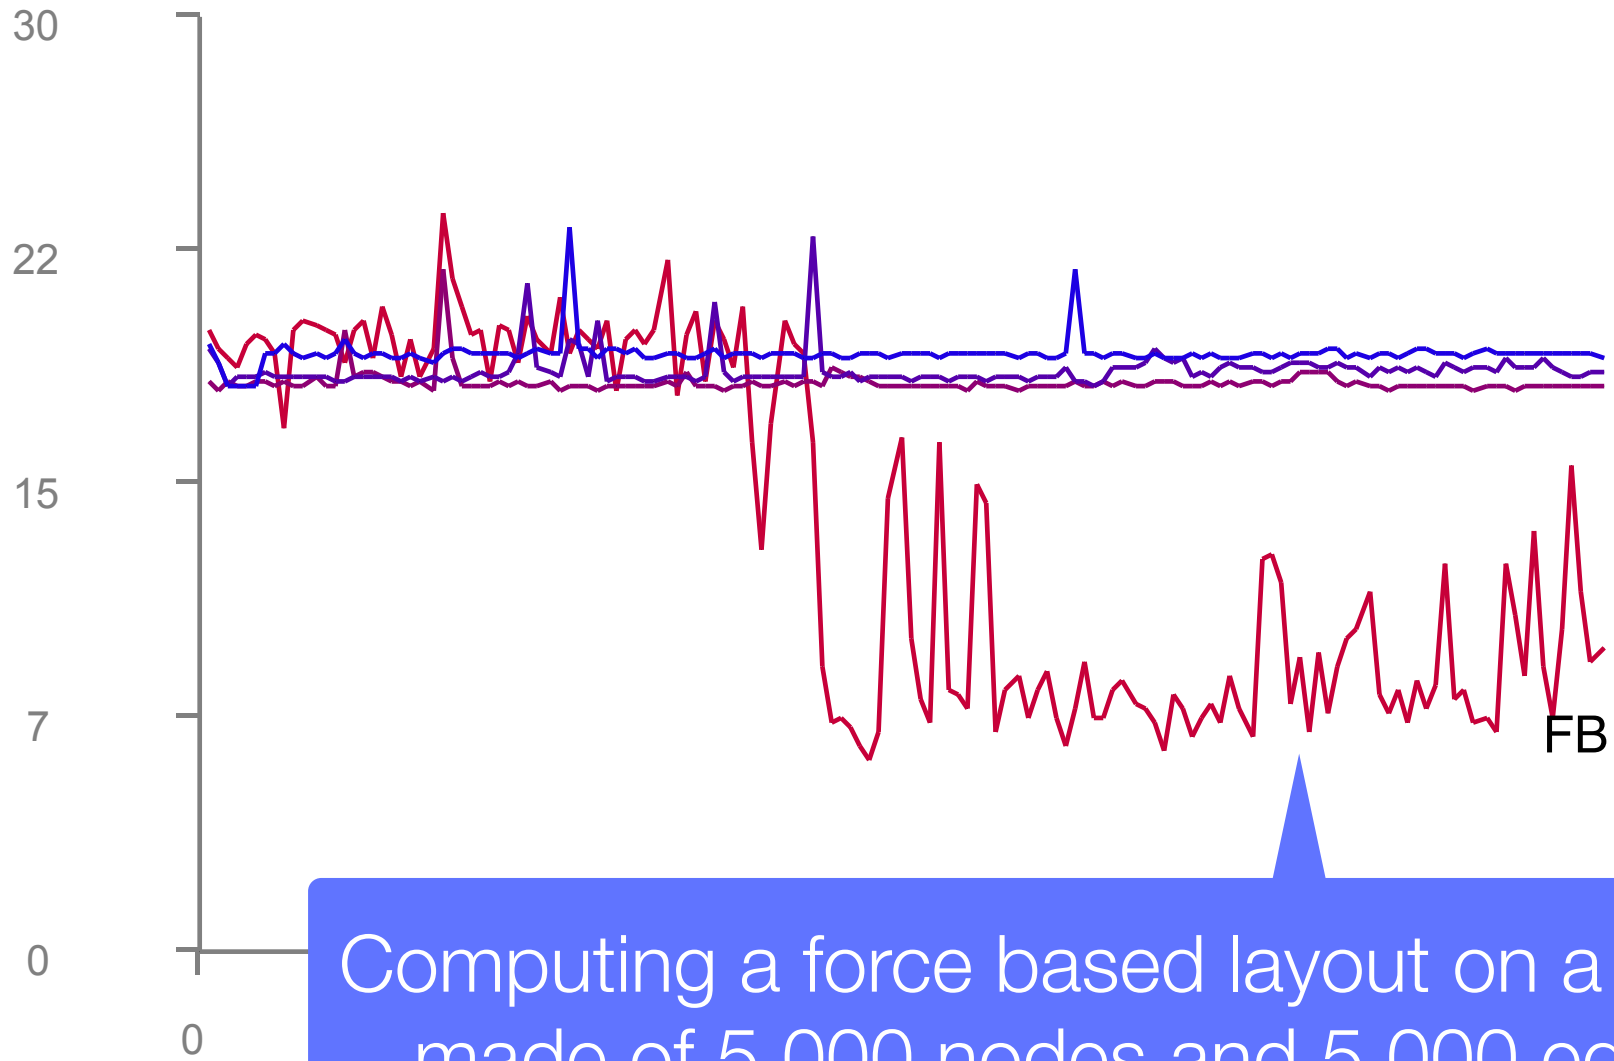

Macro-Benchmark execution

PkgPower (W)

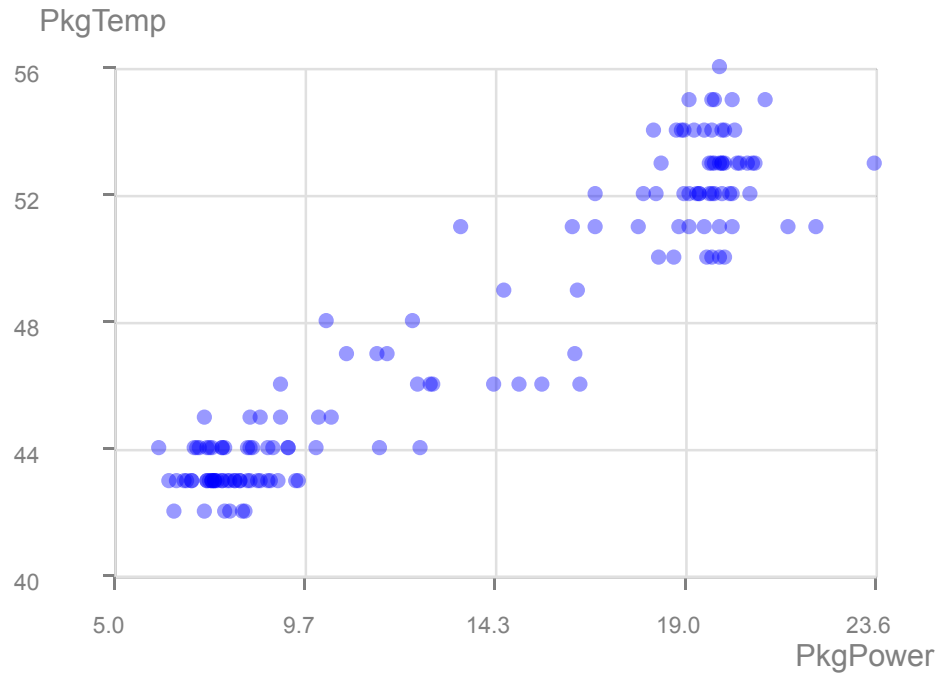

Macro-Benchmark execution

PkgPower (W)

Computing a force based layout on a graph made of 5,000 nodes and 5,000 edges

PkgPower x PkgTemp

FB Benchmark

(force based layout on
5K nodes & 5K edges)

Plot Benchmark

(plotting 30K values)

Implementation

```
EnergyProfiler new profile: [ ...]
```

```
EnergyProfiler new  
  profile: [ (Delay forSeconds: 2) wait ]
```

Can export to CSV, Roassal

Low level measurement using Intel Power Gadget
& OSSubProcess

Future work

New, challenging, exciting area

Many possible future works

replication across processors

page swapping

processor and VM intern caches
